

5 Minute Mini-Lesson

The Limit Definition of Derivative

Suppose the height of a ball is a function of time $y = f(x)$.

$$\frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} =$$

$$\text{_____} = \text{slope of secant} = \text{difference quotient} = \text{average rate of change} = \text{average velocity}$$

$$\lim_{h \rightarrow 0} \text{_____} = \text{slope of tangent} = \text{derivative} = \text{rate of change} = \text{velocity}$$
